LIST OF FIGURES

CHAPTER 1

INTRODUCTION

1.1 Introduction

This report will express the highlights and procedure to build up the application that we thought worked well in order to reach the last accomplishment. This declaration especially holds subtleties for the targets, structure display, scope, essential prerequisites, and by end announcing and watching techniques which are taken.

In today's world, people cannot think about fresh and healthy food at the same time. Because the food that we get now in the markets is mostly unhealthy. It causes us many diseases. But we can't do anything about it. Because the farm's fresh food is not available near us.

Farmfinity has brought the farms food near us. Farmfinity works with various farms and gets the goods of those farms to the people's doorsteps. Through the website, we can buy goods from our nearest farms at a cheaper rate. We don't have to take any hassle to purchase them now. We can have healthy food daily.

1.2 Motivation

We have been watching mostly in the town that people are consuming unhealthy foods. And there's rarely any website or app that sells organic farm food. So, people of town are getting sick day by day by getting these unhealthy foods.

Our motivated us to build something for the peoples who wants to have healthy food but also at a cheaper rate.

1.3 Objectives

Our website is going to help people who are looking for fresh and organic foods. This website is a single website that has mainly two parts operated by the admin and users. Admins update the products list and users buy the products from different categories.

1.4 Expected Outcome

This website will allow people to get any farm goods that are available in their nearest farms through our website. Thus, anyone will be able to eat fresh and healthy foods. Besides, they don't have to go in person to the farms. As we are offering farm goods at a cheaper rate, anyone can buy and enjoy the fresh food and get a taste of the countryside.

Thus, the final outcome of the website is to reduce people's hassle on thinking about their health and they can save their time by purchasing from home.

CHAPTER 2

BACKGROUND

2.2 Related Works

Around the world, there are some related services available. We believe that the available services are serving users properly and our website is one of them which we believe that it will serve the user properly. Some of those services are given below.

Chaldal: Chaldal is a successful online grocery retailer that has made a significant contribution to the Bangladeshi e-commerce industry. The website is a valuable resource for consumers and is likely to continue to grow in popularity in the years to come. With a variety of different daily needs products, Chaldal has become popular among users.

Meena Click: Meena Click is an online grocery store that offers a wide range of products, including fresh produce, meat and seafood, dairy and eggs, beverages, household goods, and personal care items. Meena Click delivers groceries to customers' doorsteps in Dhaka, Chittagong, and Sylhet.

2.3 Comparative Studies

According to previous points, there are some similar websites available. But the basic working principle is totally different from our website. Those are built for grocery items. On the other hand, our website's working principal is to bring fresh and organic farm food to the doorsteps of users. We are planning to make the system available for any people who want to get fresh food from farms. The main difference is that another similar website is available for any products but our website will only be available for farm goods.

CHAPTER 3

METHODOLOGY

This webpage is mainly a web base, html website. We have employed a combination of HTML, CSS, and JavaScript to develop the content and functionality of this webpage.

HTML: HTML, or Hypertext Markup Language, is the fundamental building block of webpages. It provides a structured framework for content, defining headings, paragraphs, lists, links, and more. Importantly, HTML elements carry semantic meaning, aiding search engines and assistive technologies in understanding content. Hyperlinks, text formatting, multimedia embedding, and forms are all made possible by HTML. It ensures compatibility across web browsers and supports accessibility for a broad audience, making it an essential language for web development. In summary, HTML forms the structural and semantic core of web content, enabling accessibility, organization, and universal compatibility.

CSS: CSS (Cascading Style Sheets) is a crucial component for webpages. It serves the purpose of styling and formatting web content, which includes defining fonts, colors, spacing, and layout. One of its key advantages is maintaining design consistency throughout a website, ensuring a uniform user experience. It allows for the separation of design (styling) from content (HTML), simplifying maintenance and updates. CSS also supports responsive design, making webpages adapt seamlessly to various screen sizes and devices, while enhancing accessibility and user interaction. In essence, CSS plays a pivotal role in enhancing the visual appeal and functionality of websites.

JavaScript: JavaScript is a pivotal tool for webpage development due to its capacity to introduce interactivity and dynamic elements. It empowers the creation of real-time user experiences through event-driven interactions, such as clicks and keystrokes. JavaScript also supports asynchronous requests, facilitating data retrieval without the need for full-page reloads. This versatility makes it indispensable for developing web applications, forms, and data-driven websites. It offloads processing tasks to the user's browser, optimizing webpage performance, and ensuring cross-browser compatibility. In essence, JavaScript transforms static web content into dynamic and engaging web applications.

CHAPTER 4

DESIGN SPECIFICATION

4.1 Front-end Design

A website has two parts: The front-end part and The back-end part. The front-end part is created using HTML, and CSS and the back-end part is developed using HTML, and JavaScript. The front end is mainly the visible part of the developed website that the user interacts with and is written in using HTML & CSS.

CHAPTER 5

CONCLUSION AND FUTURE SCOPE

7.1 Discussion and Conclusion

The project is finished with the help of HTML, CSS, and JavaScript. People can use it from anywhere by using any Smartphone and Web browser with the help of an internet connection. The website was designed with the aim of giving healthy and fresh farm food to people who can't have it easily.

The website works by registering as an admin who is going to maintain and update the foods and the user is going to purchase the foods.

7.2 Scope for Further Developments

It is already a user-friendly website, but in the future, we are thinking about adding some more features to make this website more user-friendly. There are some limitations in our website but we can come up with some betterment like adding more features to make it more convenient for the users. As it is a web-based website we can easily modify it at any time and it will be really helpful for the users.
